

JARVIS — Full Setup Guide

Turn a plain app into a voice assistant that reads your morning, talks back to you, and plugs directly into your personal tools (calendar, inbox, dashboards). It's open source, so it stays yours forever — no subscription lock-in on the assistant itself.

Time needed: ~20–30 minutes

Difficulty: Beginner-friendly (Claude does the heavy lifting)

 **The core workflow:** You don't build this by hand. You install **Claude Code**, provide it the project's GitHub repo link, and it automatically pulls files, installs dependencies, and configures runtime execution. You just supply API keys and connect your tools.

☑ Before You Start

- ☐ A computer running **macOS 13+, Windows 10+ (1809+)**, or **Linux** (Ubuntu 20.04+ / Debian 10+)
- ☐ **4 GB+ RAM** and an active internet connection
- ☐ A **paid Claude plan** (Pro, Max, Team, or Enterprise) — Claude Code is not available on free Claude.ai
- ☐ A **GitHub account**
- ☐ An **ElevenLabs account** (free tier provides ~10k voice credits/month)
- ☐ The **GitHub link** for the assistant project you want to install

1 Step 1 — Install Claude Code

Claude Code is the CLI agent that orchestrates setup and runs everything. Open your terminal and run the command for your OS:

MACOS / LINUX / WSL

```
curl -fsSL https://claude.ai/install.sh | bash
```

WINDOWS (POWERSHELL)

```
irm https://claude.ai/install.ps1 | iex
```

ALTERNATIVE (ANY OS, REQUIRES NODE.JS 18+)

```
npm install -g @anthropic-ai/claude-code
```

VERIFY INSTALLATION & DIAGNOSTIC CHECK

```
claude --version # should print version number
claude doctor # checks installation integrity and PATH
```

 **Troubleshooting tip:** If you get `command not found: claude`, close and restart your terminal so your shell loads the newly updated PATH. Run `claude doctor` if issues persist.

2 Step 2 — Hand Claude the Project & Install

Create a dedicated workspace folder, enter it, and initialize Claude Code:

```
mkdir jarvis && cd jarvis claude
```

Note for standard Windows PowerShell 5.1: use semicolon separators (`mkdir jarvis; cd jarvis; claude`).

Paste this prompt into Claude Code (substituting your target repo URL):

"Clone this repo into the current folder, read its README, install all dependencies, and get it running. Tell me anything you need from me (API keys, config, etc.) as you go: <PASTE-YOUR-REPO-URL>"

💡 If you don't have a project picked yet, search GitHub for "Claude voice assistant" or "voice MCP" projects and provide that link.

3 Step 3 — Add ElevenLabs Voice Output

3A. GET API KEY

1. Sign in at **elevenlabs.io**
2. Open profile → **API Keys** → create key
3. Copy and store safely

3B. PICK VOICE

1. Navigate to **Voices / Voice Library**
2. Preview options and select preferred voice
3. Copy the **Voice ID** for configuration

3C. REGISTER ELEVENLABS MCP SERVER

```
# Install uv helper (macOS/Linux) curl -LsSf https://astral.sh/uv/install.sh | sh # Add
ElevenLabs MCP to Claude Code claude mcp add elevenlabs --env ELEVENLABS_API_KEY=<your-key-
here> -- uvx elevenlabs-mcp
```

4 Step 4 & 5 — Connect Tools & Run Morning Brief

Connect your everyday apps (Calendar, Gmail, Slack, Notion) via MCP server commands:

```
claude mcp add <tool-name> --env KEY=value -- <command-to-run-that-server> claude mcp
list # verify all active connected tools
```

EXECUTE MORNING ROUTINE

"Give me my morning brief out loud: what's pending, what's important, and which emails I still haven't replied to."

🔧 Quick Troubleshooting Reference

Problem	Fix
command not found: claude	Reopen your terminal, then run <code>claude doctor</code> . Terminal needs a fresh shell to reload PATH.
Billed API rates while on Pro/Max	An <code>ANTHROPIC_API_KEY</code> in environment overrides your subscription. Unset it: <code>unset ANTHROPIC_API_KEY</code> .
MCP server not showing up	Restart Claude Code, then run <code>claude mcp list</code> to confirm registration status.
No sound / voice errors	Double-check your ElevenLabs API key and confirm you have available credits in your account dashboard.
